This image shows a region near asteroid Bennu’s equator that contains many large boulders. It was taken by NASA OSIRIS-Rex spacecraft from a distance of ~4.6 km. For scale, the triangular boulder on the horizon is ~9.2 m high, which is almost as tall as a C-130 Hercules aircraft. The image was obtained during Flyby 5A of the mission’s Detailed Survey phase. When the image was taken, the spacecraft was over the asteroid’s northern hemisphere, when the PolyCam was looking west over the equator.
